

## Effect of CARBOMETUM® on the bio-energy field of persons by GDV method (Gas Discharge Visualisation)

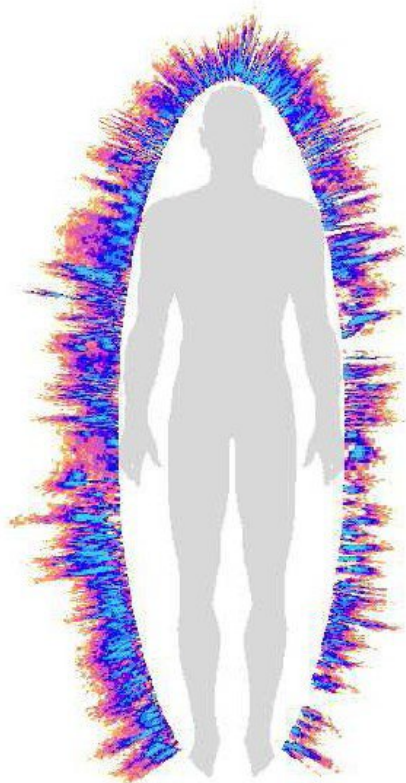

Measurements were made in a house in Domzale / Slovenia. In this house, a screed with **CARBOMETUM®** has been built in. The bio-energy field of persons were measured with the use of a GDV camera PRO, a modern variation of the Kirlian photography.

People were photographed at the beginning of the research and after standing on the screed with **CARBOMETUM®** for one half hour. Eight persons between the ages of 20 to 45 took part in this research, four men and four women, all of them physically and mentally healthy.

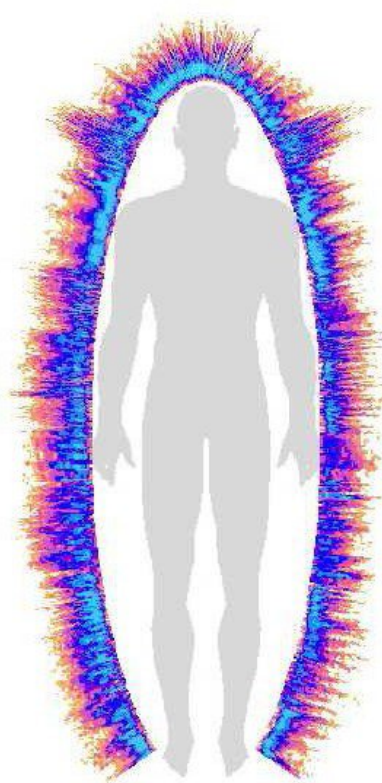

Photographing of corona's of fingers took place in a house, where people were photographed at the beginning of the research. After standing on screed with added **CARBOMETUM®** for thirty minutes, a new set of photographs was taken.

Pictures show an average value of 8 persons before and after exposure to screed with **CARBOMETUM®**. Date of snapshots: 21.02.2011.

### GDV Energy Field

**Energy Field at  
beginning of research**

**Energy Field after standing  
30 minutes on screed with **CARBOMETUM®****
